INTELLIGENT COLLABORATION SOFTWARE

OBG Developer Studio 2011 - Read Me First

1. Preliminary note

The Combionic Office Business Gateway 2011 is the next generation of the well-known framework for context-based integration into Microsoft® Office and Internet Explorer®.

With this release you are able to install OBG Client Runtime 2011 and OBG Developer Studio 2011. OBG Developer Studio 2011 requires Microsoft® Visual Studio® 2008 or Microsoft® Visual Studio® 2010. After installation the OBG Developer Studio 2011 works in "evaluation mode". There are no technical limitations, however after the 30 days evaluation period, the software can't be started anymore. To install the software we provide an integrated installer (which runs the setup in the language specified in the system settings) as well as the option of German and English specific MSI packages.

PLEASE NOTE: The installation package only installs OBG Client Runtime 2011 by default. To install OBG Developer Studio please start the following command line:

```
Combionic.OBG.Setup.de.msi DEVSTUDIO="1" resp.
```

```
Combionic.OBG.Setup.en.msi DEVSTUDIO="1"
```

Please find common limitations of the version in section 7 ("Common limitations") of this document.

2. Prerequisites

The Combionic Office Business Gateway 2011 is based on the **.NET Framework 4.0 Client Profile** and the associated components for the Office integration (**Visual Studio® Tools for Office 4.0**).

Please download components directly from the Microsoft® website to ensure that they are up-to-date.

3. OBG Developer Studio 2011 Components

The following requirements must be met for installation of the **SDK components**:

- Visual Studio® 2008 Professional or above, or Visual Studio® 2010 Professional or above
- Visual Studio® should have been started at least once before the installation to make sure the necessary settings for project templates have been applied.
- Microsoft® Office Visio 2007 or higher (only for the OBG.net Visio Template)

We recommend the use of Visual Studio® 2010!

4. Installation

To install the software we provide an integrated installer (which runs the setup in the language specified in the system settings) as well as the option of German and English specific MSI packages.

a) Installation with the integrated installer

The integrated Installer for OBG 2011 Developer Studio is named **OBG2011DevStudioSetup.exe**. Please save the executable locally (e.g. in the "Downloads" folder) and start it e.g. with a double click. You will see the following start screen:

Figure 1: Start screen OBG Developer Studio 2011

The "Install Now..." button will start the installation procedure.

During installation you can choose from 3 variants (typical, custom, complete) – we recommend using either "typical" or "custom". When choosing "typical" the setup will install all components that fit your system (e.g. Office add-in's suitable for your Office version).

When choosing "custom" you are provided with the choice of which components to install. You can select the components in the "features" tree view of the installer:

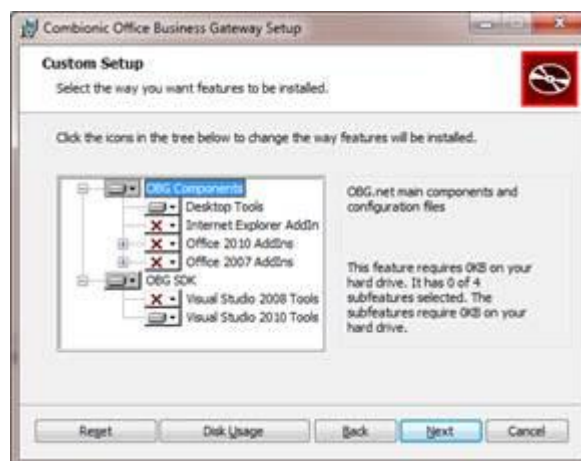

Figure 2: Custom Setup OBG Developer Studio 2011

As part of the installation, please select the desired Office integration or Internet Explorer® integration as well as the SDK, if you want to develop solutions for the Combionic Office Business Gateway.

a) Installation with the MSI packages from the command line

PLEASE NOTE: The installation package only installs OBG Client Runtime 2011 by default. To install OBG Developer Studio please start the following command line:

Combionic.OBG.Setup.de.msi DEVSTUDIO="1" resp.

Combionic.OBG.Setup.en.msi DEVSTUDIO="1"

When started the installation procedure is identical with the integrated installer which is described above.

5. Development

Compared to former versions of OBG you won't need a „Developer Key“ to start developing new OBG 2011 solutions or to compile and test the sample solution on your development machine.

Only when you want to distribute your solution to end users, you will need the developer key. Please find more information within the corresponding section of the help file.

6. Licenses

After installation the OBG Developer Studio works in “evaluation mode”. There are no technical limitations, however after the 30 days evaluation period, the software can't be started anymore. To continue using OBG Developer Studio you are required to enter a valid license code.

You can buy the licenses in different versions (with or without subscription) [on our website](#).

7. Common limitations

- Integration in Internet Explorer® 8 and 9 doesn't work correctly if you are using the protected mode. Please disable it, to evaluate the software.
- Only 32bit versions of Office and Internet Explorer® are supported.
- If you are using Internet Explorer®, it is possible that you receive an error regarding license validation. To fix this error, you have to close Internet Explorer® and then start the Stand-alone version and start the Options dialogue once.
